

Problem 4

Problem 4

Problem 1 The graph of a function f is the parabola given in the figure below.

- (a) Find a formula for $f(x)$.

Explanation. $f(x) = x^2$

- (b) Suppose F_1 is an anti-derivatives of f satisfying $F_1(0) = 2$. Sketch and label the graph of F_1 .
Sketch the graphs of three more antiderivatives of f .

Explanation.

Problem 4

- (c) Using the expression you found in part (a) and your sketches in part (b), find the algebraic representation of F_1 .

Explanation. The general antiderivative is $F(x) = \frac{1}{3}x^3 + C$. Therefore,

$$F_1(x) = \frac{1}{3}x^3 + C, \text{ for some constant } C.$$

Since $F_1(0) = 2$, it follows that $2 = \frac{1}{3}(0)^3 + C = C$. Therefore, $F_1(x) = \frac{1}{3}x^3 + 2$.

- (d) Suppose we're given $h(x) = (1/3)x^3 + 17$, what is $h'(x)$?

Explanation. $h'(x) = x^2$.

- (e) What is the relationship between f , F_1 , h , and h' ?

Explanation. We have $F_1' = f = h'$ and $h = F_1 + C$, where C is some constant. Determine this constant!
