

Problem 4

Problem 4

Problem 1 Find all real numbers which satisfy each of the equations. In the previous problem, we used θ to denote the radian measure of the angle. However, we can use any variable to represent the angle measure. For example, in part a, x is the variable representing the radian measure of the angle.

(a) $\cos(x) = 1$

(b) $\sin(3\theta) = \sqrt{3}/2$ for $0 \leq \theta \leq 2\pi$
