

Problem 4

Problem 4

Problem 1 A box with two square sides is constructed to have a volume of 27. Denote the dimensions of the length of the base as y , and the width and height as x , as labeled in the diagram below. Find the dimensions needed to minimize the surface area of the box.

Solve the problem by performing the following steps.

- (a) Find a formula for $S(x)$ the surface area of the box, as a function of only the variable x .
- (b) Find the interval of interest for $S(x)$.
- (c) Find the x -value that gives the minimum surface area over all such boxes.
