

Problem 12

Problem 12

Problem 1 The graph of $h(t)$ represents the height in feet of water in a pool at time t minutes.

- During what time intervals is the height of water in the pool increasing? Decreasing?
- Assume the rate of change of the water in the pool is 0 when $t = 0$. For what other values of t is the rate of change of the water in the pool 0?
- If $h(t)$ represents the height of the feet in water at time t minutes. What function represents the rate of change of the height over time?
- Sketch a graph of the rate of change of the height over time, $h'(t)$.
