

Problem 8

Problem 8

Problem 1 Suppose a taxi ride costs \$7.50 for the first mile (or any part of the first mile), plus an additional \$1.00 for each additional mile (or any part of a mile).

- (a) Graph the function $c = f(t)$ that gives the cost of a taxi ride for t miles, for $0 \leq t \leq 5$.

Explanation.

- (b) Evaluate $\lim_{t \rightarrow 2.9} f(t)$

Explanation. $\lim_{t \rightarrow 2.9} f(t) = 9.5$

- (c) Evaluate $\lim_{t \rightarrow 3^-} f(t)$ and $\lim_{t \rightarrow 3^+} f(t)$

Explanation. $\lim_{t \rightarrow 3^-} f(t) = 9.5$ and $\lim_{t \rightarrow 3^+} f(t) = 10.5$

- (d) Interpret the meaning of the limits in part (c).

Problem 8

Explanation. As the number of miles the taxi drives approaches 3, the cost of the taxi ride is \$9.50. If one drives for a bit more than 3 miles, the cost is \$10.50.

- (e) *On what intervals is the function c continuous? Explain.*

Explanation. $(0, 1], (1, 2], (2, 3], (3, 4], (4, 5]$
