

Problem 10

Problem 10

Problem 1 (a) True or False: If the acceleration of an object is constant, then its velocity is constant.

(b) True or False: A moving object can have negative acceleration and increasing speed.

Explanation. True. If your velocity is negative (which means that you are moving in the negative direction) then a negative acceleration increases the magnitude (or absolute value) of the velocity. But the magnitude of the velocity is the speed.
