

Problem 11

Problem 11

Problem 1 *In your own words, explain why $L_a(x)$ is a good approximation of the function f for x values $x \approx a$.*

Explanation. The graph of $L_a(x)$ is the line tangent to the graph of f at $(a, f(a))$. For a differentiable function, the tangent line is very close to the graph of the function for x -values near that point.
