

Problem 7

Problem 7

Problem 1 What point on the parabola $y = 5 - x^2$ is closest to the point $(4, 7)$?

Explanation.

We have “to minimize $d \iff$ to minimize d^2 ”.

Objective function:

$$\begin{aligned} d^2 &= (x - 4)^2 + (y - 7)^2 \text{ and } y = 5 - x^2 \implies d^2 = (x - 4)^2 + ((5 - x^2) - 7)^2 \\ &\implies f(x) = (x - 4)^2 + (x^2 + 2)^2 \end{aligned}$$

We may assume $\text{Domain}(f) = [0, \sqrt{5}]$.

Critical points:

$$\begin{aligned} f'(x) &= 2(x - 4) + 2(x^2 + 2) \cdot 2x \\ &= 4x^3 + 10x - 8. \end{aligned}$$

f' is defined everywhere on $(0, \sqrt{5}) \implies$ critical points only occur where $f'(x) = 0$:

$$f'(x) = 0 \iff 4x^3 + 10x - 8 = 0$$

using a calculator to find an approximate value of $x \implies x \approx 0.67628$

Problem 7

Find global minimum:

$$f(0) = 20$$

$$f(0.67628) \approx 17.1$$

$$f(\sqrt{5}) \approx 52.1$$

$$\implies \text{global minimum at } x \approx 0.67628$$
