

Problem 1

Problem 1

**Problem 1** (a) Let  $f(x) = \frac{x-1}{x^2-5x}$ . Then  $f(2) = -\frac{1}{6}$  and  $f(6) = \frac{5}{6}$ , but there is no value of  $c$  between 2 and 6 for which  $f(c) = 0$ . Does this fact violate the Intermediate Value Theorem?

(b) True or False: At some time since you were born your weight in pounds exactly equaled your height in inches.
