

Problem 7

Problem 7

Problem 1 John is walking along a straight path. His position at the time $t > 0$ is given by $s = f(t)$. He starts at $t = 0$ from his house ($f(0) = 0$) and the graph of f is given below.

- Describe the motion of John as precisely as you can.
- When is John's velocity zero? What is happening to John at those times?
- When is John moving in the positive direction? When is John the furthest in the positive direction and the furthest in the negative direction?
- When is John's velocity increasing? And when is it decreasing? When is John going at maximum velocity?
