

Problem 5

Problem 1 Find the radius of a cylindrical container with a volume of $2\pi \text{ m}^3$ that minimizes the surface area.

(**HINT: surface area , $S = 2\pi rh + 2r^2\pi$;
volume , $V = r^2\pi h$.**)

Explanation. We have two formulas: $V = \pi r^2 h$ and $S = 2\pi rh + 2r^2\pi$. We know $V = 2\pi$ and want to find the r that minimizes S . Since we need a formula for S only in terms of r we are going to rewrite $V = \pi r^2 h$ to give us a formula for h in terms of r .

$$\begin{aligned} V = 2\pi \text{ and } V = \pi r^2 h &\implies 2\pi = \pi r^2 h \\ \frac{2\pi}{\pi r^2} &= h \\ \frac{2}{r^2} &= h \\ \implies S(r) &= 2\pi r \left(\frac{2}{r^2} \right) + 2r^2\pi \\ S(r) &= \frac{4\pi}{r} + 2r^2\pi \end{aligned}$$

The domain is $(0, \infty)$.

Next, we need to minimize S .

$$\begin{aligned} S'(r) &= \frac{-4\pi}{r^2} + 4\pi r \\ &= 4\pi \left(r - \frac{1}{r^2} \right) \end{aligned}$$

Problem 5

To find the critical points:

$$\begin{aligned}r - \frac{1}{r^2} &= 0 \\r &= \frac{1}{r^2} \\r^3 &= 1 \\r &= 1\end{aligned}$$

The only critical point of S is at $r = 1$. We need to verify $r = 1$ is a local extremum.

We can use the second derivative test:

$$\begin{aligned}S''(r) &= 8\pi r^{-3} + 4\pi \\ \implies S''(1) &= 8\pi + 4\pi > 0\end{aligned}$$

The function S has a local minimum at $r = 1$. So $(1, S(1))$ is the global minimum since this is the only local extremum. (See Theorem 4.5).
