

Problem 3

Problem 3

Problem 1 Assume that the rate of change (in dollars per day) of the price of shares of stock in the WeSaySo Company (with t in days) is modeled by the equation $r(t) = -3t^2 + 30t - 63$ (note that this is technically a discrete function, but prices change so often with stocks that modeling this with a continuous function makes sense). Assume also that the price of a share of stock on day 1 (i.e., $t = 1$) is \$51. Answer the following questions:

- (a) Find the rate of change of price at $t = 5$.

Explanation. $r(5) = -3(25) + 30(5) - 63 = -75 + 150 - 63 = 12$ dollars/day.

- (b) Find the price of a share of stock at $t = 5$.

Explanation. Let $p(t)$ denote the price of a share of stock at any time t . Then notice that $r(t) = p'(t)$. We will first find $p(t)$ for general t , and then substitute $t = 5$ to solve this problem.

$$\begin{aligned} p(t) &= \int_1^t r(s) ds + p(1) \\ &= \int_1^t (-3s^2 + 30s - 63) ds + 51 \\ &= \left[-s^3 + 15s^2 - 63s \right]_1^t + 51 \\ &= (-t^3 + 15t^2 - 63t) - (-1 + 15 - 63) + 51 \\ &= -t^3 + 15t^2 - 63t + 100. \end{aligned}$$

So, $p(5) = -125 + 375 - 315 + 100 = 35\$$.

- (c) How fast is the rate of change of price changing at $t = 5$?

Explanation. $r'(t) = -6t + 30$. So, $r'(5) = -30 + 30 = 0$.

- (d) How much did the price of a share of stock change in the first 6 days (i.e., on $[1, 6]$)?

Explanation. $p(6) - p(1) = (-216 + 540 - 378 + 100) - 51 = -5\$$.

- (e) What was the greatest rate of change of price during the first 6 days (i.e., on $[1, 6]$)? [3]

Problem 3

Explanation. This question wants us to maximize $r(t)$ on the closed interval $[1, 6]$. So we need to find all critical points of $r(t)$ on $[1, 6]$.

$$r'(t) = -6t + 30 := 0 \implies t = 5$$

Then, using the closed interval method, we simply plug $t = 1, 5, 6$ into $r(t)$ and check which has the greatest output.

$$r(1) = -3 + 30 - 63 = -36$$

$$r(5) = -75 + 150 - 63 = 12$$

$$r(6) = -108 + 180 - 63 = 9.$$

Thus, the greatest rate of change of price is 12 dollars/day when $t = 5$.

- (f) What was the greatest price of a share of stock during the first 6 days (i.e., on $[1, 6]$)? [3]

Explanation. This question wants us to maximize $p(t)$ on the closed interval $[1, 6]$. So we need to find all critical points of $p(t)$ on $[1, 6]$. But note that $p'(t) = r(t)$. So critical points of $p(t)$ are just roots of $r(t)$.

$$r(t) = 0$$

$$-3t^2 + 30t - 63 = 0$$

$$-3(t^2 - 10t + 21) = 0$$

$$-3(t - 3)(t - 7) = 0$$

$$t = 3, 7 \implies t = 3$$

since 7 is not in the interval $[1, 6]$. So we use the Closed Interval Method:

$$p(1) = -1 + 15 - 63 + 100 = 51$$

$$p(3) = -27 + 135 - 189 + 100 = 19$$

$$p(6) = -216 + 540 - 378 + 100 = 46$$

Thus, the greatest price of the stock is \$51 when $t = 1$.
